

Notes:
 A zone of reduced bearing capacity will exist landward of a receding erosion scarp. Definition of the extent of the zone of reduced bearing capacity will require professional assessment on a site by site basis. An additional allowance in this regard should be included in considering the immediate hazard zone.

The accuracy of predicting these hazard lines is subject to many uncertainties. The existence of bedrock, indurated sands and/or structures may impact on the realisation of the hazards.

Coastal features and structures have been observed and digitally plotted using photogrammetric techniques. Hazard lines have been determined and plotted relative to the photogrammetry data. Cadastral boundaries as shown may not have been survey corrected and are presented for guidance.

Coastal Hazards Line (2010)
 — Immediate Hazard Line
 - - - 2050 Hazard Line
 - - - 2100 Hazard Line

Coastal Hazards Line (2014)
 - - - Immediate Hazard Line
 - - - Maximum 2050 Hazard Line
 - - - Maximum 2100 Hazard Line
