

Tweed Catchment riparian species selection guide

Western tributaries- including Upper Oxley, Hopping Dicks, Pumpenbil and Brays Creek

A healthy riparian zone can armour the stream banks against erosion, slow the flow of water during high flow events and supply the waterway with vital woody debris for in-stream habitat and strength. A broad diversity of riparian vegetation will provide the best soil binding capacity with the combination of different root structures.

When planting, it's important to match the plants to the area of the riverbank where they belong – from the top of the bank to the toe where each plays an important but different role in stabilising the bank.
